Multicast packet routing device. The network, through the multicast router, informs the end user application about the available multicast services device.

The end user requests the network to deliver a copy of a particular multicast stream.

The network commences delivery of the multicast packet stream.

Periodically, the network asia the end user to confirm that they still want to receive the multicast stream.

The end user confirms that the stream is still desired.

The network continues packet stream delivery.

End user

multicast

application
